

A farmer wants a program to perform basic calculations related to farming.

The program should:

- Display the farmer's profile.
- Add the weights of two harvested crops.
- Find the square root of the total harvested area.
- Calculate the area of a triangular field.
- Swap the quantities of two fertilizer bags if entered in the wrong order.

Code:

```
import math
# Farmer Profile
name = input("Farmer Name: ")
crop = input("Crop: ")
print("\nProfile:", name, "-", crop)

# Add crop weights
w1 = float(input("Weight 1: "))
w2 = float(input("Weight 2: "))
print("Total Weight =", w1 + w2)

# Square root of harvested area
area = float(input("Harvested Area: "))
print("Square Root =", math.sqrt(area))

# Area of triangular field
b = float(input("Base: "))
h = float(input("Height: "))
print("Triangle Area =", 0.5 * b * h)

# Swap fertilizer bag quantities
a = int(input("Bag 1 Quantity: "))
c = int(input("Bag 2 Quantity: "))
a, c = c, a
print("After Swapping:", a, c)
```

output:

```
Profile: mohan - 17
Weight 1: 6
Weight 2: 5
Total Weight = 11.0
Harvested Area: 12
Square Root = 3.4641016151377544
Base: 17
Height: 19
Triangle Area = 161.5
Bag 1 Quantity: 12
Bag 2 Quantity: 13
After Swapping: 13 12
```
